USD - Manufacturing PMI (Apr) P

USD - Manufacturing PMI (Apr) P

Event	USD - Manufacturing PMI (Apr) P			Description
Actual:				The Manufacturing Purchasing Managers' Index (PMI) is a diffusion index incorporating survey results provided by manufacturing firms throughout the country. A reading above fifty suggests the manufacturing sector is expanding, while a reading below fifty suggests the manufacturing sector is in contraction. Policymakers and traders watch these surveys closely as purchasing managers usually have early access to data about their company's performance, rather than waiting for the hard data to emerge. While manufacturing accounts for a far smaller percentage of economic output than services, it is far more cyclical and is therefore a useful indicator of where in the economic cycle the economy is currently situated. A reading that is stronger than forecast is generally supportive (bullish) for the USD while a weaker than forecast reading is generally negative (bearish) for the USD. Learn More: USDJPY EURUSD

USD - Services PMI (Apr) P

USD - Services PMI (Apr) P

Event	USD - Services PMI (Apr) P			Description
Actual:				The Service PMI release is published monthly by Markit Economics. The data are based on surveys of over 400 executives in private sector service companies. The surveys cover transport and communication, financial intermediaries, business and personal services, computing & IT, hotels and restaurants. An index level of 50 denotes no change since the previous month, while a level above 50 signals an improvement, and below 50 indicates a deterioration. A reading that is stronger than forecast is generally supportive (bullish) for the USD, while a weaker than forecast reading is generally negative (bearish) for the USD. Learn More: USDJPY EURUSD

USD - New Home Sales (Mar)

USD - New Home Sales (Mar)

Event	USD - New Home Sales (Mar)			Description
Actual:				New Home Sales measures the annualised number of new single-family homes that were sold during the prior month. When it's released ahead of Existing Home Sales, this report tends to have more impact because the two reports are highly correlated. A reading that is stronger than forecast is generally supportive (bullish) for the USD, while a weaker than forecast reading is generally negative (bearish) for the USD. Learn More: USDJPY EURUSD

Key Economic & Analytical Concepts

Economic Data Interpretation

- **Forecast Vs. Actual:** Comparing predicted values with released data
- **Previous Reading:** Last reported value, used as a benchmark
- **Market Impact:** How releases affect financial markets

Price Movements

- **Max Movement:** Largest upward price move after event
- **Min Movement:** Largest downward price move after event
- Both measured in Volatility Units

Average True Range (ATR)

- **Definition:** A technical indicator that measures market volatility
- **Calculations:**
 - Calculate True Range (TR) for each period:
 - $TR = \max [(high - low), abs(high - previous\ close), abs(low - previous\ close)]$
 - $ATR = \text{Simple moving average of TR over N periods (typically 14)}$
- **Interpretation:**
 - Higher ATR = Higher Volatility
 - Lower ATR = Lower Volatility
- **Usage in Our Analysis:**
 - Helps standardize price movements across different market conditions
 - Forms the basis of our Volatility Unit Calculations

Using This Analysis

- Analyzing volatility across different economic releases helps identify patterns in market reactions.
- This approach allows for evaluating the significance of economic indicators based on their market impact.
- Adhering to standard trading guidelines, the risk amount should not exceed 5% of the trading balance. A risk-reward ratio of 1:4x–6x, guided by the win ratio and historical data from this presentation or other estimates, can be used to determine the appropriate risk level, take-profit point, and position size.
- Trade automation on the MTS platform can be implemented using the expert advisor linked below, which takes the specified parameters as input.
- **Example:**
 - Volatility analysis of economic releases, such as the Non-Farm Payroll (NFP) event, helps identify patterns in market reactions. For instance, if the NFP event typically results in a minimum movement of 0.5x and a maximum movement of 3x, a stop-loss of 1x and a take-profit of 3x can be strategically applied.
 - Following prudent risk management, the risk per trade should not exceed 5% of the trading balance, typically. For a \$100,000 trading account (max loss amount post which trading is halted), this translates to a \$5,000 stop-loss and a \$15,000 take-profit.
 - The guiding principle is that a win ratio of at least 50% combined with a risk-reward ratio of over 2x ensures positive expected cash flow. By limiting risk to 5% of the account balance, potential drawdowns from consecutive losses are minimized, preserving capital and maintaining positive cash flow expectations.
- If you need further assistance, please don't hesitate to contact us.

Volatility Unit

- **Formula:** $(ATR * multiple) + Spread$ (multiple is typically 1.5)
- **Purpose:** Standardizes price movements
