USD - Services PMI (Jul)

USD - Services PMI (Jul)

Event	USD - Services PMI (Jul)			Description
Actual:				-The Service PMI release is published monthly by Markit Economics. The data are based on surveys of over 400 executives in private sector service companies. The surveys cover transport and communication, financial intermediaries, business and personal services, computing & IT, hotels and restaurants. An index level of 50 denotes no change since the previous month, while a level above 50 signals an improvement, and below 50 indicates a deterioration. A reading that is stronger than forecast is generally supportive (bullish) for the USD, while a weaker than forecast reading is generally negative (bearish) for the USD. Learn more: USDJPY EURUSD

USD - ISM Non-Manufacturing PMI (Jul)

USD - ISM Non-Manufacturing PMI (Jul)

Event	USD - ISM Non-Manufacturing PMI (Jul)			Description
Actual:				
Forecast:				
Previous:	50.80			
Time (GMT):	14:00			
Release Date	Actual	Forecast	Previous	The Institute of Supply Management (ISM) Non-Manufacturing Purchasing Managers' Index (PMI) (also known as the ISM Services PMI) report on Business, is based on data compiled from monthly replies to questions asked of more than 370 purchasing and supply executives in over 62 different industries.
03-Jul-25	50.80	50.80	49.90	The NMI is a composite index based on the diffusion indexes for four of the indicators with equal weights: Business Activity (seasonally adjusted), New Orders (seasonally adjusted), Employment (seasonally adjusted) and Supplier Deliveries.
04-Jun-25	49.90	52.00	51.60	A reading above 50 percent indicates the non-manufacturing sector economy is generally expanding; below 50 percent indicates the non-manufacturing sector is generally contracting. Given the large proportion of the US economy engaged in the services sector, this report offers insights into the health of the overall US economy.
05-May-25	51.60	50.20	50.80	A reading that is stronger than forecast is generally supportive (bullish) for the USD, while a weaker than forecast reading is generally negative (bearish) for the USD.
03-Apr-25	50.80	53.00	53.50	Learn more: USDJPY EURUSD
05-Mar-25	53.50	52.50	52.80

(Jul)

USD - ISM Non-Manufacturing Prices (Jul)

Event	USD - ISM Non-Manufacturing Prices (Jul)			Description
Actual:				-The Institute of Supply Management (ISM) Non-Manufacturing Purchasing Managers' Index (PMI) (also known as the ISM Services PMI) report on Business, is based on data compiled from monthly replies to questions asked of more than 370 purchasing and supply executives in over 62 different industries. The Prices Paid subcategory is a diffusion index calculated by adding the percent of responses indicating they paid more for inputs plus one-half of those responding that they paid the same for inputs. The resulting single index number is then seasonally adjusted. The Prices Paid diffusion index is one of a number of indicators pointing to the degree of inflationary pressures in the economy. A reading that is stronger than forecast is generally supportive (bullish) for the USD, while a weaker than forecast reading is generally negative (bearish) for the USD. Learn more: USDJPY EURUSD

USD - Crude Oil Inventories

USD - Crude Oil Inventories

Event	USD - Crude Oil Inventories			Description
Actual:				-The Energy Information Administration's (EIA) Crude Oil Inventories measures the weekly change in the number of barrels of commercial crude oil held by US firms. The level of inventories influences the price of petroleum products, which can have an impact on inflation. If the increase in crude inventories is more than expected, it implies weaker demand and is bearish for crude prices. The same can be said if a decline in inventories is less than expected. If the increase in crude is less than expected, it implies greater demand and is bullish for crude prices. The same can be said if a decline in inventories is more than expected. USD - 10-Year Note Auction

USD - 10-Year Note Auction

Event	USD - 10-Year Note Auction			Description
Actual:				
Forecast:				
Previous:	4.36%			
Time (GMT):	17:00			
Release Date	Actual	Forecast	Previous	-The figures displayed in the calendar represent the yield on the Treasury Note auctioned. U.S. Treasury Notes have maturities of two to ten years. Governments issue treasuries to borrow money to cover the gap between the amount they receive in taxes and the amount they spend to refinance existing debt and/or to raise capital. The rate on a Treasury Note represents the return an investor will receive by holding the note for its entire duration. All bidders receive the same rate at the highest accepted bid. Yield fluctuations should be monitored closely as an indicator of the government debt situation. Investors compare the average rate at auction to the rate at previous auctions of the same security. Learn more: USDJPY EURUSD

Important Information

Quantwater Tech Investments Data Release Deck – 04th August 2025

This document is for informational purposes only and does not constitute investment advice, an offer, or a solicitation to buy or sell any securities or financial instruments.

Past performance is not indicative of future results. Investments involve inherent risks, including the possible loss of principal. No representation or warranty, express or implied, is made regarding the accuracy, completeness, or reliability of the information contained herein.

The information in this presentation is derived from publicly available sources and internal analysis as of the date indicated and is subject to change without notice. Quantwater Tech Investments and its affiliates do not undertake any obligation to update or revise this material.

Neither Quantwater Tech Investments nor any of its affiliates, officers, or employees shall be liable for any direct or indirect losses arising from the use of this information. Any misrepresentation is strictly prohibited.

Key Economic & Analytical Concepts

Economic Data Interpretation

- **Forecast Vs. Actual:** Comparing predicted values with released data
- **Previous Reading:** Last reported value, used as a benchmark
- **Market Impact:** How releases affect financial markets

Average True Range (ATR)

- **Definition:** A technical indicator that measures market volatility
- **Calculations:**
 - Calculate True Range (TR) for each period:
 - $TR = \max [(high - low), abs(high - previous\ close), abs(low - previous\ close)]$
 - $ATR = \text{Simple moving average of TR over N periods (typically 14)}$
- **Interpretation:**
 - Higher ATR = Higher Volatility
 - Lower ATR = Lower Volatility
- **Usage in Our Analysis:**
 - Helps standardize price movements across different market conditions
 - Forms the basis of our Volatility Unit Calculations

Volatility Unit

- **Formula:** $(ATR * multiple) + Spread$ (multiple is typically 1.5)
- **Purpose:** Standardizes price movements

Price Movements

- **Max Movement:** Largest upward price move after event
- **Min Movement:** Largest downward price move after event
- Both measured in Volatility Units

Using This Analysis

- Analyzing volatility across different economic releases helps identify patterns in market reactions.
- This approach allows for evaluating the significance of economic indicators based on their market impact.
- Adhering to standard trading guidelines, the risk amount should not exceed 5% of the trading balance. A risk-reward ratio of 1:4x–6x, guided by the win ratio and historical data from this presentation or other estimates, can be used to determine the appropriate risk level, take-profit point, and position size.
- Trade automation on the MT5 platform can be implemented using the expert advisor linked below, which takes the specified parameters as input.
- An MT5 account can be accessed through a [brokerage/securities dealer firm or by using a proprietary \(prop\) trading account](#).
- **Example:**
 - Volatility analysis of economic releases, such as the Non-Farm Payroll (NFP) event, helps identify patterns in market reactions. For instance, if the NFP event typically results in a minimum movement of 0.5x and a maximum movement of 3x, a stop-loss of 1x and a take-profit of 3x can be strategically applied.
 - Following prudent risk management, the risk per trade should not exceed 5% of the trading balance, typically. For a \$100,000 trading account (max loss amount post which trading is halted), this translates to a \$5,000 stop-loss and a \$15,000 take-profit.
 - The guiding principle is that a win ratio of at least 50% combined with a risk-reward ratio of over 2x ensures positive expected cash flow. By limiting risk to 5% of the account balance, potential drawdowns from consecutive losses are minimized, preserving capital and maintaining positive cash flow expectations.
- If you need further assistance, please don't hesitate to contact us.
